OWNER’S MANUAL

⚠️ Read this manual carefully. It contains safety information.
Quick Reference Guide

This Quick Reference Guide will assist you in finding the information you’re looking for.

A Table of Contents is included after the Foreword.
Whenever you see the symbols shown below, heed their instructions! Always follow safe operating and maintenance practices.

⚠️ **DANGER**

DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

⚠️ **WARNING**

WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

---

**NOTICE**

NOTICE is used to address practices not related to personal injury.

**NOTE**

〇 NOTE indicates information that may help or guide you in the operation or service of the vehicle.
NOTICE

THIS PRODUCT HAS BEEN MANUFACTURED FOR USE IN A REASONABLE AND PRUDENT MANNER BY A QUALIFIED OPERATOR AND AS A VEHICLE ONLY.
TAMPERING WITH NOISE CONTROL SYSTEM PROHIBITED

Owners are warned that the law may prohibit:
(a) The removal or rendering inoperative by any person other than for purposes of maintenance, repair or replacement, of any device or element of design incorporated into any new vehicle for the purpose of noise control prior to its sale or delivery to the ultimate purchaser or while it is in use; and
(b) The use of the vehicle after such device or element of design has been removed or rendered inoperative by any person.
FOREWORD

Congratulations on your purchase of a new Kawasaki motorcycle. Your new motorcycle is the product of Kawasaki’s advanced engineering, exhaustive testing, and continuous striving for superior reliability, safety and performance.

Please read this Owner’s Manual carefully before riding so that you will be thoroughly familiar with the proper operation of your motorcycle’s controls, its features, capabilities, and limitations. This manual offers many safe riding tips, but its purpose is not to provide instruction in all the techniques and skills required to ride a motorcycle safely. Kawasaki strongly recommends that all operators of this vehicle enroll in a motorcycle rider training program to attain awareness of the mental and physical requirements necessary for safe motorcycle operation.

To ensure a long, trouble-free life for your motorcycle, give it the proper care and maintenance described in this manual. For those who would like more detailed information on their Kawasaki Motorcycle, a Service Manual is available for purchase from any authorized Kawasaki motorcycle dealer. The Service Manual contains detailed disassembly and maintenance information. Those who plan to do their own work should, of course, be competent mechanics and possess the special tools described in the Service Manual.

Keep this Owner’s Manual aboard your motorcycle at all times so that you can refer to it whenever you need information.

WARNING
Incorrect loading, improper installation or use of accessories, or modification of your motorcycle may result in an unsafe riding condition. Before you ride the motorcycle, make sure it is not overloaded and that you have followed these instructions.

With the exception of genuine Kawasaki Parts and Accessories, Kawasaki has no control over the design or application of accessories. In some cases, improper installation or use of accessories, or motorcycle modification, will void the motorcycle warranty. In selecting and using accessories, and in loading the motorcycle, you are personally responsible for your own safety and the safety of other persons involved.

NOTE
Kawasaki Parts and Accessories have been specially designed for use on Kawasaki motorcycles. We strongly recommend that all parts and accessories you add to your motorcycle be genuine Kawasaki components.

Because a motorcycle is sensitive to changes in weight and aerodynamic forces, you must take extreme care in carrying cargo, passengers and/or in the fitting of additional accessories. The following general guidelines have
been prepared to assist you in making your determinations.

1. Any passenger should be thoroughly familiar with motorcycle operation. The passenger can affect control of the motorcycle by improper positioning during cornering and sudden movements. It is important that the passenger sit still while the motorcycle is in motion and not interfere with the operation of the motorcycle. Do not carry animals on your motorcycle.

2. You should instruct any passenger before riding to keep his feet on the passenger footpegs and hold on to the operator or seat strap. Do not carry a passenger unless he or she is tall enough to reach the footpegs and footpegs are provided.

3. All baggage should be carried as low as possible to reduce the effect on the motorcycle center of gravity. Baggage weight should also be distributed equally on both sides of the motorcycle. Avoid carrying baggage that extends beyond the rear of the motorcycle.

4. Baggage should be securely attached. Make sure that the baggage will not move around while you are riding. Recheck baggage security as often as possible (not while the motorcycle is in motion) and adjust as necessary.

5. Do not carry heavy or bulky items on a luggage rack. They are designed for light items, and overloading can affect handling due to changes in weight distribution and aerodynamic forces.
6. Do not install accessories or carry baggage that impairs the performance of the motorcycle. Make sure that you have not adversely affected any lighting components, road clearance, banking capability (i.e., lean angle), control operation, wheel travel, front fork movement, or any other aspect of the motorcycle’s operation.

7. Weight attached to the handlebar or front fork will increase the mass of the steering assembly and can result in an unsafe riding condition.

8. Fairings, windshields, backrests, and other large items have the capability of adversely affecting stability and handling of the motorcycle, not only because of their weight, but also due to the aerodynamic forces acting on these surfaces while the motorcycle is in operation. Poorly designed or installed items can result in an unsafe riding condition.

9. This motorcycle was not intended to be equipped with a sidecar or to be used to tow any trailer or other vehicle. Kawasaki does not manufacture sidecars or trailers for motorcycles and cannot predict the effects of such accessories on handling or stability, but can only warn that the effects can be adverse and that Kawasaki cannot assume responsibility for the results of such unintended use of the motorcycle. Furthermore, any adverse effects on motorcycle components caused by the use of such accessories will not be remedied under warranty.

**Maximum Load**

| Weight of rider, passenger, baggage, and accessories must not exceed 181 kg (399 lb). |

B. RESET Button
C. Tachometer
D. Odometer/Trip Meter
E. AB/Fuel Warning Message
F. Speedometer
G. Coolant Temperature Warning Indicator Light
H. High Beam Indicator Light
I. Neutral Indicator Light
J. Turn Signal Indicator Light
K. Red Zone
Meter Instruments:
The meter displays all segments for a few seconds when the ignition key is turned to “ON”. The tachometer momentarily goes from the minimum to the maximum, then goes back from the maximum to the minimum reading to check its operation. If any meter instruments or tachometer does not operate or display correctly, have it checked by an authorized Kawasaki dealer.

Tachometer:
The tachometer shows the engine speed in revolutions per minute (r/min, rpm). On the right side of the tachometer face is a portion called the “red zone”. Engine r/min (rpm) in the red zone is above maximum recommended engine speed and is also above the range for good performance.

NOTE
- This motorcycle is equipped with the engine speed limiter to prevent the excessive high engine speed. When operating this limiter, the segments of the tachometer indicate the different engine speed and stops at about 5000 r/min (rpm) for the ignition control, but this operation is not a failure.

NOTICE
- Engine r/min (rpm) should not be allowed to enter the red zone; operation in the red zone will overstress the engine and may cause serious engine damage.

Speedometer:
The speedometer shows the speed of the vehicle in digital values.
22 GENERAL INFORMATION

Odometer/Trip Meter AB (ODO/TRIP AB):
This meter displays the odometer, the trip meter AB, and the fuel warning message.
The odometer and the trip meter AB can be shifted pushing the MODE button.

A. Odometer
B. Trip meter A
C. Trip meter B
D. MODE Button

NOTE
- Do not shift the odometer/trip meter while riding for safe operation.

Odometer -
The odometer shows the total distance in kilometers or miles that the vehicle has been ridden. This meter cannot be reset.

NOTE
- The data is maintained even if the battery is disconnected.
- When the figures come to 999999, they are stopped and locked.

Trip Meters A/B -
The trip meter shows the distance in kilometers or miles traveled since it was last reset to zero.
To reset the trip meter:
• Push the MODE button to display the trip meter A or B.
• Push the RESET button and hold it in.
• After two seconds, the figure display turns to 0.0, and then starts counting when the vehicle is operated. The meter counts until it is next reset.

NOTE
○ The data is maintained by the back-up power if the ignition key is turned off.
○ When the trip meter reaches 999.9 (TRIP A) or 9999.9 (TRIP B) while riding, the meter resets to 0.0 and continues counting.
○ When the battery is disconnected, the meter display resets to 0.0.

Mile/Km Display:
Mile/Km Display can alternate between English and metric modes (mph and km/h) in the meter unit. Make sure that km/h or mph according to local regulations is correctly displayed before riding.
24 GENERAL INFORMATION

NOTE

○ Do not operate the vehicle with the meter unit displaying in the wrong unit (km/h or mph). Shift the km/h·mph display in the meter unit as follows.

- Display the odometer.
- The km/h·mph display shifts by pushing the RESET button while the MODE button pushed in.

A. Km/h·Mph Display

- The km/h/mph display shifts as follows.

Clock:
To adjust hours and minutes:
- Turn the ignition key to “ON”.
- Push the RESET button for more than two seconds. Both the hour and minute displays start blinking.

NOTE

○ The data is maintained even if the battery is disconnected.
• Push the RESET button. The hour display only blinks. Push the MODE button to advance the hours.

• Push the RESET button. The hour display stops blinking and the minute display starts blinking. Push the MODE button to advance the minutes.

• Push the MODE button. The displays stop blinking and the clock starts working.

NOTE

○ Pushing the MODE button momentarily advances the hour or minute step by step. Pushing and holding the button advances the hour or minute continuously.

○ The clock works normally from the back-up power while the ignition switch is turned off.
When the battery is disconnected, the clock resets to 1:00 and starts working again when the battery is connected.

Warning/Indicator Light:
N : When the transmission is in neutral, the neutral indicator light is lit.
❖❖ : When the turn signal switch is turned to left or right, the turn signal indicator light blinks on and off.
❖❖ : When the headlight is on high beam, the high beam indicator light is lit.

The coolant temperature warning indicator light goes on when the ignition key is turned to “ON” and goes off soon after ensuring that its circuit function properly. The warning indicator light also goes on whenever the coolant temperature rises too high when the motorcycle is in operation. If it stays on, stop the engine and check the coolant level in the reserve tank after the engine cools down.

NOTICE
Do not let the engine continue running when the coolant temperature warning indicator light goes on. Prolonged engine operation will result in severe damage from overheating.
Key
This motorcycle has a combination key, which is used for the ignition switch/steering lock, helmet hook, and fuel tank cap.
Blank keys are available at your Kawasaki dealers. Ask your dealer to make any additional spare keys you may need, using your original key as a master.

Ignition Switch/Steering Lock
This is a three-position, key-operated switch. The key can be removed from the switch when it is in the OFF or LOCK position.

A. Ignition Switch/Steering Lock
B. ON position
C. OFF position
D. LOCK position

**NOTE**
- The headlight and taillight are on whenever the ignition key is in the ON position. To avoid battery discharge, always start the engine immediately after turning the ignition key to “ON”.

To lock the steering:
1. Turn the handlebar fully to the left.
2. For locking, push down the key in the OFF position and turn it to Lock position.
3. Pull the key out.

**NOTE**
- If the steering is hard to lock, turn the handlebar slightly to the left or the right.
Right Handlebar Switches

Engine Stop Switch:
In addition to the ignition switch, the engine stop switch must be in the position for the motorcycle to operate.
The engine stop switch is for emergency use. If required, move the switch to the position.

NOTE
○ Although the engine stop switch stops the engine, it does not turn off all the electrical circuits. Ordinarily, the ignition switch should be used to stop the engine.

Starter Button:
The starter button operates the electric starter when the transmission is in neutral.
Refer to the Starting the Engine section of the "How to Ride the Motorcycle" chapter for starting instructions.

Fuel Tank Cap

To open the fuel tank cap, insert the ignition key into the fuel tank cap, turn the key to the right while pushing down the fuel tank cap.

To close the cap, push it down into place with the key inserted. The key can be removed by turning it to the left to the original position.

**NOTE**

- The fuel tank cap cannot be closed without the key inserted, and the key cannot be removed unless the cap is locked properly.
- Do not push on the key to close the cap, or the cap cannot be locked.
Fuel Tank

Fuel Requirements:
Your Kawasaki engine is designed to use only unleaded gasoline with a minimum octane rating shown below. Never use gasoline with an octane rating lower than the minimum specified by Kawasaki to prevent severe engine damage.

The octane rating of a gasoline is a measure of its resistance to detonation or "knocking". The term commonly used to describe a gasoline’s octane rating is the Research Octane Number (RON).

NOTICE

Do not use leaded gasoline, as this will destroy the catalytic converter. (For further information, refer to the "Catalytic Converter" section in the "How to Ride the Motorcycle" chapter.)
If engine “knocking” or “pinging” occurs, use a different brand of gasoline of a higher octane rating. If this condition is allowed to continue, it can lead to severe engine damage. Gasoline quality is important. Fuels of low quality or not meeting standard industry specifications may result in unsatisfactory performance. Operating problems that result from the use of poor quality or no recommended fuel may not be covered under your warranty.

**NOTICE**

Fuel Type and Octane Rating

Use clean, fresh unleaded gasoline with an ethanol volume content not more than 10 % and an octane rating equal to or higher than that shown in the table.

**NOTICE**

Do not use any fuel that contains more ethanol or other oxygenates than specified for E10 fuel* in this vehicle. Damage to the engine and fuel system, or engine starting and/or performance problems may result from the use of improper fuel.
Filling the Tank:
Avoid filling the tank in the rain or where heavy dust is blowing so that the fuel does not get contaminated.

A. Tank Cap
B. Fuel Tank
C. Top Level
D. Filler Neck

**WARNING**
Gasoline is extremely flammable and can be explosive under certain conditions, creating the potential for serious burns. Turn the ignition switch to “OFF”. Do not smoke. Make sure the area is well-ventilated and free from any source of flame or sparks; this includes any appliance with a pilot light. Never fill the tank completely to the top. If the tank is filled completely to the top, heat may cause the fuel to expand and overflow through the vents in the tank cap. After refueling, make sure the tank cap is closed securely. If gasoline is spilled on the fuel tank, wipe it off immediately.
**NOTICE**

Certain ingredients in gasoline may cause paint fading or damage. Be extra careful not to spill gasoline or gasoline oxygenates blends during refueling.

**Fuel Tap**

The fuel tap has three positions: OFF, ON, and RES (reserve). For normal operation, turn the tap lever to the ON position. If the fuel runs out with the tap in the ON position, the last 1.9 L (0.50 US gal) of fuel can be used by turning the fuel tap lever to RES.

A. Fuel Tap
B. ON position
C. OFF position
D. RES position
NOTE
○ Since riding distance is limited when on RES, refuel at the earliest opportunity.
○ Make certain that the fuel tap lever is turned to ON (Not RES) after filling up the fuel tank.

WARNING
Practice operating the fuel tap with the motorcycle stopped. To prevent an accident you should be able to operate the fuel tap while riding without taking your eyes off the road.
Be careful not to touch the hot engine while operating the fuel tap.

Stand
The motorcycle is equipped with a side stand.

NOTE
○ When using the side stand, turn the handlebar to the left.

Do not sit on the motorcycle while it is on its side stand. Always kick the stand fully up before sitting on the motorcycle.
NOTE

- The motorcycle is equipped with a side stand switch. This switch is designed so that the engine does not start if the transmission is in gear and the side stand is down.

Helmet Hook

Helmet can be secured to the motorcycle using the helmet hook. The helmet hook can be unlocked by inserting the ignition key into the lock, and turning the key to the right.

A. Helmet Hook
WARNING

Riding with helmet attached to the hook could cause an accident by distracting the operator or interfering with normal vehicle operation. Do not ride the motorcycle with helmet attached to the hook.

Tool Kit Bag/Tool Kit

The tool kit is stored in the tool kit bag. The kit contains tools that can be helpful in making roadside repairs, adjustments, and some maintenance procedures explained in this manual.

A. Tool Kit
B. Tool Kit Bag

Seat Removal

• Remove the mounting bolts.

Seat Installation

• Align the front hook with the front receiver and slide the seat forward.
• Slide the seat forward so that the center hook and the center receiver engages.

- Tighten the tandem band bolts.
- Pull up the rear end of the seat to make sure it is securely tightened.
- Reinstall the parts removed.

Rear View Mirror

**Rear View Mirror Adjustment**

- Adjust the rear view mirror by slightly moving only the mirror portion of the assembly.

A Rear View Mirror
The first 1,600 km (1,000 mi) that the motorcycle is ridden is designated as the break-in period. If the motorcycle is not used carefully during this period, you may very well end up with a "broken down" instead of a "broken in" motorcycle after a few thousand kilometers.

The following rules should be observed during the break-in period.

- The table shows maximum recommended engine speed during the break-in period.

<table>
<thead>
<tr>
<th>Distance traveled</th>
<th>Maximum engine speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 ~ 800 km (0 ~ 500 mi)</td>
<td>4,000 r/min (rpm)</td>
</tr>
<tr>
<td>800 ~ 1,600 km (500 ~ 1,000 mi)</td>
<td>6,000 r/min (rpm)</td>
</tr>
</tbody>
</table>

**NOTE**

- When operating on public roadways, keep maximum speed under traffic law limits.

- Do not start moving or race the engine immediately after starting it, even if the engine is already warm. Run the engine for two or three minutes at idle speed to give the oil a chance to work up into all the engine parts.

- Do not race the engine while the transmission is in neutral.
WARNING

New tires are slippery and may cause loss of control and injury. A break-in period of 160 km (100 miles) is necessary to establish normal tire traction. During break-in, avoid sudden and maximum braking and acceleration, and hard cornering.

In addition to the above, at 1000 km (600 mi) it is extremely important that the owner have the initial maintenance service performed by an authorized Kawasaki dealer.
Starting the Engine
• Turn the fuel tap lever to "ON".
• Check that the engine stop switch is in the position.
• Turn the ignition key to "ON".
• Make certain the transmission is in neutral.

If the engine is cold, pull out the choke knob all the way.

NOTE
○ When the engine is already warm or on hot days (35°C, 95°F or more), close the throttle completely without using the choke knob, and then start the engine.
• Leaving the throttle completely closed, push the starter button.

**NOTICE**

Do not operate the starter continuously for more than 5 seconds or the starter will overheat and the battery power will drop temporarily. Wait 15 seconds between each operation of the starter to let it cool and the battery power recover.

**NOTE**

- If the engine is flooded, crank the engine over with the throttle fully open until the engine starts.
- The motorcycle is equipped with a starter lockout switch. This switch is designed so that the engine does not start if the transmission is in gear and the side stand is down. However, the engine can be started if the clutch lever is pulled and the side stand is fully up.

- When the engine is warmed up enough to idle without using the push, return the choke knob all the way back.
NOTE

○ If you drive the motorcycle before the engine is warmed up, push the choke knob all the way back as soon as you start moving.

NOTICE

Do not let the engine idle longer than five minutes, or engine overheating and damage may occur.

Jump Starting

If your motorcycle battery is "run down", it should be removed and charged. If this is not practical, a 12 volt booster battery and jumper cables may be used to start the engine.
Battery acid generates hydrogen gas which is flammable and explosive under certain conditions. It is present within a battery at all times, even in a discharged condition. Keep all flames and sparks (cigarettes) away from the battery. Wear eye protection when working with a battery. In the event of battery acid contact with skin, eyes, or clothing, wash the affected areas immediately with water for at least 5 minutes. Seek medical attention.

Connecting Jumper Cables

- Remove the left side cover.
- Make sure the ignition switch is turned "OFF".

Connect a jumper cable from the positive (+) terminal of the booster battery to the positive (+) terminal of the motorcycle battery.
• Connect another jumper cable from the negative (–) terminal of the booster battery to your motorcycle foot peg or other unpainted metal surface. Do not use the negative (–) terminal of the battery.

**DANGER**

Batteries contain sulfuric acid that can cause burns and produce hydrogen gas which is highly explosive. Do not make this last connection at the fuel system or battery. Take care not to touch the positive and negative cables together, and do not lean over the battery when making this last connection. Do not connect to a frozen battery. It could explode. Do not reverse polarity by connecting positive (+) to negative (–), or a battery explosion and serious damage to the electrical system may occur.

• Follow the standard engine starting procedure.
NOTICE

Do not operate the starter continuously for more than 5 seconds or the starter will overheat and the battery power will drop temporarily. Wait 15 seconds between each operation of the starter to let it cool and the battery power recover.

- After the engine has started, disconnect the jumper cables. Disconnect the negative (−) cable from the motorcycle first.
- Reinstall the parts removed.

Moving Off

- Check that the side stand is up.
- Pull in the clutch lever.
- Shift into 1st gear.
- Open the throttle a little, and start to let out the clutch lever very slowly.
- As the clutch starts to engage, open the throttle a little more, giving the engine just enough fuel to keep it from stalling.

A. Shift Pedal
50 HOW TO RIDE THE MOTORCYCLE

NOTE
- The motorcycle is equipped with a side stand switch. This switch is designed so that the engine does not start if the transmission is in gear and the side stand is down.

Shifting Gears
- Close the throttle while pulling in the clutch lever.
- Shift into the next higher or lower gear.

WARNING
Downshifting to a lower gear at high speed causes engine rpm to increase excessively, potentially damaging the engine and it may also cause the rear wheel to skid and cause an accident. Downshifting should be done below 5,000 rpm for each gear.

- Open the throttle part way, while releasing the clutch lever.
Braking

- Close the throttle completely, leaving the clutch engaged (except when shifting gears) so that the engine will help slow down the motorcycle.
- Shift down one gear at a time so that you are in 1st gear when you come to a complete stop.
- When stopping, always apply both brakes at the same time. Normally the front brake should be applied a little more than the rear. Shift down or fully disengage the clutch as necessary to keep the engine from stalling.
- Never lock the brakes, or it will cause the tires to skid. When turning a corner, it is better not to brake at all. Reduce your speed before you get into the corner.

- For emergency braking, disregard downshifting, and concentrate on applying the brakes as hard as possible without skidding.
A. Rear Brake Pedal

Stopping the Engine

- Close the throttle completely.
- Shift the transmission into neutral.
- Turn the ignition key to "OFF".
- Support the motorcycle on a firm level surface with the side stand.
- Lock the steering.
- Turn the fuel tap lever to the OFF position.
Stopping the Motorcycle in an Emergency

Your Kawasaki Motorcycle has been designed and manufactured to provide you optimum safety and convenience. However, in order to fully benefit from Kawasaki’s safety engineering and craftsmanship, it is essential that you, the owner and operator, properly maintain your motorcycle and become thoroughly familiar with its operation. Improper maintenance can create a dangerous situation known as throttle failure. Two of the most common causes of throttle failure are:

1. An improperly serviced or clogged air cleaner may allow dirt and dust to enter the carburetor and stack the throttle open.

2. During removal of the air cleaner, dirt is allowed to enter and jam the carburetor.

In an emergency situation such as throttle failure, your vehicle may be stopped by applying the brakes and disengaging the clutch. Once this stopping procedure is initiated, the engine stop switch may be used to stop the engine. If the engine stop switch is used, turn off the ignition switch after stopping the motorcycle.
Parking

**WARNING**

Operating or parking the vehicle near flammable materials can cause a fire, and can result in property damage or severe personal injury. Do not idle or park your vehicle in an area where tall or dry vegetation, or other flammable materials could come into contact with the muffler or exhaust pipe.

**WARNING**

The engine and exhaust system get extremely hot during normal operation and can cause serious burns. Never touch a hot engine, exhaust pipe, or muffler during operation or after stopping the engine.

- Shift the transmission into neutral and turn the ignition key to "OFF".
- Support the motorcycle on a firm, level surface with the side stand.

**NOTICE**

Do not park on a soft or steeply inclined surface, or the motorcycle may fall over.
• If parking inside a garage or other structure, be sure it is well ventilated and the motorcycle is not close to any source of flame or sparks; this includes any appliance with a pilot light.

**WARNING**

Gasoline is extremely flammable and can be explosive under certain conditions, creating the potential for serious burns. Turn the ignition switch to “OFF”. Do not smoke. Make sure the area is well ventilated and free from any source of flame or sparks; this includes any appliance with a pilot light.

• Lock the steering to help prevent theft.

• Turn the fuel tap lever to the OFF position.
Catalytic Converter

This motorcycle is equipped with a catalytic converter in the exhaust system. The converter reacts with carbon monoxide, hydrocarbons and nitrogen oxides to convert them into carbon dioxide, water, nitrogen and oxygen resulting in much cleaner exhaust gases to be discharged into the atmosphere.

For proper operation of the catalytic converter, the following cautions must be observed.

⚠️ WARNING
Operating or parking the vehicle near flammable materials can cause a fire, and can result in property damage or severe personal injury.
Do not idle or park your vehicle in an area where tall or dry vegetation, or other flammable materials could come into contact with the muffler or exhaust pipe.

⚠️ WARNING
The engine and exhaust system get extremely hot during normal operation and can cause serious burns.
Never touch a hot engine, exhaust pipe, or muffler during operation or after stopping the engine.
• Use only unleaded gasoline. Never use leaded gasoline. Leaded gasoline significantly reduces the capability of the catalytic converter.
• Do not coast the vehicle with the ignition switch and/or engine stop switch off. Do not attempt to start the engine by rolling the vehicle if the battery is discharged. Do not operate the vehicle with the engine of the cylinder misfiring. Under this conditions unburned air/fuel mixture flowing out of engine excessively accelerates reaction in the converter allowing the converter to overheat and become damaged when the engine is hot, or reduces converter performance when the engine is cold.

Safe Riding Technique

The points given below are applicable for everyday motorcycle use and should be carefully observed for safe and effective vehicle operation.

For safety, eye protection and a helmet are strongly recommended. You should be aware of and verify the applicable safety regulations in force prior to riding your motorcycle. Gloves and suitable footwear should also be used for added protection in case of a mishap.

A motorcycle does not provide the impact protection of an automobile, so defensive riding in addition to wearing protective apparel is extremely important. Do not let protective apparel give you a false sense of security.

When riding always keep both hands on the handlebars and both feet on the footpegs. Removing your hands from the handlebars or feet from the footpegs while riding can be hazardous. If you remove even one hand or foot, you can reduce your ability to control the motorcycle.

Before changing lanes, look over your shoulder to make sure the way is clear. Do not rely solely on the rear view mirror; you may misjudge a vehicle’s distance and speed, or you may not see it at all.
In general your actions should be smooth as sudden acceleration, braking or turning may cause loss of control, especially when riding in wet conditions or on loose roadway surfaces, when the ability to maneuver will be reduced.

When going up steep slopes, shift to a lower gear so that there is plenty of power to spare rather than overloading the engine.

When applying the brakes, use both the front and rear brakes. Applying only one brake for sudden braking may cause the motorcycle to skid and lose control.

When going down long slopes, control vehicle speed by closing the throttle. Use the front and rear brakes for auxiliary braking.

In wet conditions, rely more on the throttle to control vehicle speed and less on the front and rear brakes. The throttle should also be used judiciously to avoid skidding the rear wheel from too rapid acceleration or deceleration.

Riding at the proper rate of speed and avoiding unnecessarily fast acceleration are important not only for safety and low fuel consumption but also for long vehicle life and quieter operation.
On rough roads, exercise caution, slow down, and grip the fuel tank with the knees for better stability.

When quick acceleration is necessary as in passing, shift to a lower gear to obtain the necessary power.

Do not downshift at too high an r/min (rpm) to avoid damage to the engine from overrevving.

Avoiding unnecessary weaving is important to the safety of both the rider and other motorists.
Daily Checks

Check the following items each day before you ride. The time required is minimal, and habitual performance of these checks will help ensure you a safe, reliable ride. If any irregularities are found during these checks, refer to the Maintenance and Adjustment chapter or see your dealer for the action required to return the motorcycle to a safe operating condition.

\[ \text{WARNING} \]

Failure to perform these checks before operation may result in serious damage or an accident. Always perform daily checks before operation.

\[ \text{DANGER} \]

Exhaust gas contains carbon monoxide, a colorless, odorless poisonous gas. Inhaling carbon monoxide can cause serious brain injury or death. Do not run the engine in enclosed areas. Operate only in a well-ventilated area.
62 SAFE OPERATION

Fuel ......................... Adequate supply in tank, no leaks.
Engine oil ................. Oil level between level lines.
Tires ......................... Air pressure (when cold):

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Install the air valve cap.

Drive chain ................ Slack 35 ~ 45 mm (1.4 ~ 1.8 in.).
Lubricate if dry.

Nuts, bolts, fasteners .. Check that steering and suspension components, axles, and all controls are properly tightened or fastened.

Steering ..................... Action smooth but not loose from lock to lock. No binding of control cables.

Brakes ....................... Brake pad wear: Lining thickness more than 1 mm (0.04 in.) left.
No brake fluid leakage.

Throttle ...................... Throttle grip play 2 ~ 3 mm (0.08 ~ 0.12 in.).
Clutch ......................... Clutch lever play 2 ~ 3 mm (0.08 ~ 0.12 in.).
Clutch lever operates smoothly.
Coolant ....................... No coolant leakage.  
Coolant level between level lines (when engine is cold).

Electrical equipment ... All lights (Head, Tail/Brake, Turn Signal, Warning/Indicator) and horn work.

Engine stop switch ...... Stops engine.
Side stands ................. Return to its fully up position by spring tension.  
Return springs not weak or not damaged.
Additional Considerations for Off Road Operation

**Brakes:** The importance of reliable brakes is obvious. Check to see that they are correctly adjusted and functioning properly.

**Steering:** Looseness in the steering can cause loss of control. Check to see that the handlebar turns freely but has no play.

**Tires:** Due to the extra stress to the tires on rough roads, be sure to examine their overall condition, and inflate to the proper pressure.

**Drive Chain:** When not adjusted properly, the severe stress on rough roads can cause damage to the sprockets and cause the chain to be thrown. Examine the chain slack and alignment, and lubricate if necessary.

**Fuel:** Have sufficient fuel for the high fuel consumption on rough roads.

**Engine Oil:** To avoid seizure and resulting loss of control, make certain the oil level is at the upper level line.

**Coolant:** To avoid engine overheating, check that the coolant level is at the upper level line.

**Miscellaneous:** Check to see that the electrical equipment is functioning properly, all nuts and bolts are tight, and all safety related parts are in good condition.
Additional Considerations for High Speed Operation

**Brakes:** The importance of the brakes, especially during high speed operation, cannot be overemphasized. Check to see that they are correctly adjusted and functioning properly.

**Steering:** Looseness in the steering can cause loss of control. Check to see that the handlebar turns freely but has no play.

**Tires:** High speed operation is hard on tires, and good tires are crucial for riding safety. Examine their overall condition, inflate them to the proper pressure, and check the wheel balance.

**Fuel:** Have sufficient fuel for the high fuel consumption during high speed operation.

**Engine Oil:** To avoid engine seizure and resulting loss of control, make sure that the oil level is at the upper level line.

**Coolant:** To avoid overheating, check that the coolant level is at the upper level line.

**Electrical Equipment:** Make sure that the headlight, tail/brake light, turn signals, horn, etc., all work properly.

**Miscellaneous:** Make sure that all nuts and bolts are tight and that all safety related parts are in good condition.
WARNING

Handling characteristics of a motorcycle at high speeds may vary from those you are familiar with at legal highway speeds. Do not attempt high speed operation unless you have received sufficient training and have the required skills.
The maintenance and adjustments outlined in this chapter must be carried out in accordance with the Periodic Maintenance Chart to keep the motorcycle in good running condition. The initial maintenance is vitally important and must not be neglected.

With a basic knowledge of mechanics and the proper use of tools, you should be able to carry out many of the maintenance items described in this chapter. If you lack proper experience or doubt your ability, all adjustment, maintenance, and repair work should be completed by a qualified technician.

Please note that Kawasaki cannot assume any responsibility for damage resulting from incorrect or improper adjustment done by the owner.

Engine Oil

In order for the engine, transmission, and clutch to function properly, maintain the engine oil at the proper level, and change the oil and oil filter in accordance with the Periodic Maintenance Chart. Not only do dirt and metal particles collect in the oil, but the oil itself loses its lubricative quality if used too long.

**WARNING**

Motorcycle operation with insufficient, deteriorated, or contaminated engine oil will cause accelerated wear and may result in engine or transmission seizure, accident, and injury. Check the oil level before each ride and change the oil according to the periodic maintenance chart in the Owner’s Manual.

**NOTICE**

Racing the engine before the oil reaches every part can cause engine seizure.

- Situate the motorcycle so that it is perpendicular to the ground.
- If the oil has just been changed, start the engine and run it for several minutes at idle speed. This fills the oil filter with oil. Stop the engine, then wait several minutes until the oil settles.

- If the motorcycle has just been used, wait several minutes for all the oil to drain down.

**Oil Level Inspection**

- Situate the motorcycle so that it is perpendicular to the ground.
- If the oil has just been changed, start the engine and run it for several minutes at idle speed. This fills the oil filter with oil. Stop the engine, then wait several minutes until the oil settles.

- If the motorcycle has just been used, wait several minutes for all the oil to drain down.
- Check the engine oil level through the oil level inspection window in the lower right side of the engine. The oil level should come up between the upper and lower level lines next to the oil level inspection window.

- If the oil level is too high, remove the excess oil through the oil filler opening using a syringe or some other suitable device.

- If the oil level is too low, add the oil to reach the correct level. Use the same type and brand of oil that is already in the engine.

80 MAINTENANCE AND ADJUSTMENT

Oil and/or Oil Filter Change

- Warm up the engine thoroughly, and then stop it.
- Set the motorcycle up on its side stand.
- Place an oil pan beneath the engine.
- Remove the engine oil drain plug.

A. Drain Plug

- Let the oil completely drain with the motorcycle perpendicular to the ground.

WARNING

Engine oil is a toxic substance. Dispose of used oil properly. Contact your local authorities for approved disposal methods or possible recycling.
If the oil filter is to be changed, remove the oil filter cover bolts and take off the cover with O-ring.

- Replace the element with a new one.

Apply a little grease around the element fence hole against the grommet side, and put the spring on the element fence hole.

Install the element with the spring so that the spring fits into the proper position.
MAINTENANCE AND ADJUSTMENT

- Apply a little engine oil to the grommet, and install the oil filter cover and tighten its bolts.

**NOTE**
- Install the oil filter cover while aligning the holes of the cover.

- After the oil has completely drained out, install the engine oil drain plug with its gasket. Proper torque for it is shown in the table.

**NOTE**
- Replace any gasket with a new one.

- Fill the engine up to the upper level line with a good quality motor oil specified in the table.
- Start the engine.
- Check the oil level and for oil leakage.

Recommended Engine Oil

Type: API SG, SH, SJ, SL, or SM with JASO MA, MA1 or MA2
Viscosity: SAE 10W-40

NOTE

○ Do not add any chemical additive to the oil. Oils fulfilling the above requirements are fully formulated and provide adequate lubrication for both the engine and the clutch.

Engine Oil Capacity

Capacity: 1.0 L (1.1 US qt) [when filter is not removed]
1.1 L (1.2 US qt) [when filter is removed]
1.3 L (1.4 US qt) [when engine is completely dry]

Although 10W-40 engine oil is the recommended oil for most conditions, the oil viscosity may need to be changed to accommodate atmospheric conditions in your riding area.
Cooling System

Radiator and Cooling Fan -
Check the radiator fins for obstruction by insects or mud. Clean off any obstructions with a stream of low-pressure water.

⚠️ WARNING
The cooling fan spins at high speed and can cause serious injuries. Keep your hands and clothing away from the cooling fan blades at all times.

NOTICE
Using high-pressure water, as from a car wash facility, could damage the radiator fins and impair the radiator’s effectiveness. Do not obstruct or deflect airflow through the radiator by installing unauthorized accessories in front of the radiator or behind the cooling fan. Interference with the radiator airflow can lead to overheating and consequent engine damage.

Radiator Hoses -
Check the radiator hoses for leakage, cracks or deterioration, and connections for leakage, or looseness each day before riding the motorcycle, and in accordance with the Periodic Maintenance Chart.
Coolant -
Coolant absorbs excessive heat from the engine and transfers it to the air at the radiator. If the coolant level becomes low, the engine overheats and may suffer severe damage. Check the coolant level each day before riding the motorcycle, and in accordance with the periodic maintenance chart, and replenish coolant if the level is low. Change the coolant in accordance with the Periodic Maintenance Chart.

Information for Coolant
To protect the cooling system (consisting of the aluminum engine and radiator) from rust and corrosion, the use of corrosion and rust inhibitor chemicals in the coolant is essential. If coolant containing corrosion and rust inhibitor chemicals is not used, over a period of time, the cooling system accumulates rust and scale in the water jacket and radiator. This will clog up the coolant passages, and considerably reduce the efficiency of the cooling system.

⚠️ WARNING

Coolant containing corrosion inhibitors for aluminum engines and radiators include harmful chemicals for human body. Drinking coolant can result in serious injury or death. Use coolant in accordance with the instructions of the manufacturer.

Soft or distilled water must be used with the antifreeze (see below for antifreeze) in the cooling system.
If hard water is used in the system, it causes scale accumulation in the water passages, and considerably reduces the efficiency of the cooling system.

If the lowest ambient temperature encountered falls below the freezing point of water, use permanent antifreeze in the coolant to protect the cooling system against engine and radiator freeze-up, as well as from rust and corrosion.

Use a permanent type of antifreeze (soft water and ethylene glycol plus corrosion and rust inhibitor chemicals for aluminum engines and radiators) in the cooling system. On the mixture ratio of coolant, choose the suitable one referring to the relation between freezing point and strength directed on the container.

Permanent types of antifreeze on the market have anti-corrosion and anti-rust properties. When it is diluted excessively, it loses its anti-corrosion property. Dilute a permanent type of antifreeze in accordance with the instructions of the manufacturer.

○ A permanent type of antifreeze is installed in the cooling system when shipped. It is colored green and contains ethylene glycol. It is mixed at 50% and has the freezing point of –35°C (–31°F).

Coolant Level Inspection
• Check the coolant level with the motorcycle held level. The coolant level
should be between the F(FULL) and L(LOW) level lines.

**NOTE**
○ Check the level when the engine is cold (room or atmospheric temperature.)

- If the amount of coolant is insufficient, after removing the left side cover, unscrew the cap from the reserve tank and add coolant through the filler opening to the F(FULL) level line.
- Install the cap.

**NOTE**
○ In an emergency you can add water alone to the coolant reserve tank, however it must be returned to the correct mixture ratio by the addition of antifreeze concentrate as soon as possible.

A. Reserve Tank  
B. F(FULL) Level Line  
C. L(LOW) Level Line  
D. Tank Cap  
E. Left Side Cover
NOTICE
If coolant must be added often, or the reserve tank completely runs dry, there is probably leakage in the system. Have the cooling system inspected by your authorized Kawasaki dealer.

Coolant Change
Have the coolant changed by an authorized Kawasaki dealer.

Coolant Filter Clean
Before the winter season starts, have the coolant filter cleaned by an authorized Kawasaki dealer.

Spark Plugs
The standard spark plug is shown in the table. The spark plug should be taken out in accordance with the Periodic Maintenance Chart for cleaning, inspection, and resetting of the plug gap.

Maintenance
If the plug is oily or has carbon built up on it, clean it. The plug may also be cleaned using a high flash-point solvent and a nonmetal brush (nylon etc.). Measure the gap with a wire-type thickness gauge, and adjust the gap if incorrect by bending the outer electrode. If the spark plug electrodes are corroded or damaged, or if the insulator is cracked, replace the plug. Use the standard plug.

**NOTE**

- If a torque wrench is not available, this item should be serviced by a Kawasaki dealer.

**NOTICE**

For cold weather and/or low speed riding, a hotter spark plug shown in the table may be used for quicker warm-ups and more efficient engine operation. However, for normal temperatures and/or high speed use, the standard spark plug must be used to prevent engine damage.

Hotter Spark Plug

NGK CR7E
Valve Clearance
Valve and valve seat wear decreases valve clearance, upsetting valve timing.

**NOTICE**

If valve clearance is left unadjusted, wear will eventually cause the valves to remain partly open, which lowers performance, burns the valves and valve seats, and may cause serious engine damage.

Valve clearance for each valve should be checked and adjusted in accordance with the Periodic Maintenance Chart. Inspection and adjustment should be done only by an authorized Kawasaki dealer.

Air Cleaner
A clogged air cleaner restricts the engine's air intake, increasing fuel consumption, reducing engine power, and causing spark plug fouling.

The air cleaner element must be cleaned in accordance with the Periodic Maintenance Chart. In dusty areas, the element should be cleaned more frequently than the recommended interval. After riding through rain or on muddy roads, the element should be cleaned immediately. The element should be replaced if it is damaged.
**Element Removal**

- Remove the seat.
- Unscrew the air cleaner intake cap bolts and remove the air cleaner intake cap.

![](image)

- Remove the wing bolt, and take out the element.

92 MAINTENANCE AND ADJUSTMENT

- Remove the element from the frame.

A. Element

- Put a clean, lint-free towel over the air cleaner housing to keep dirt or other foreign material from entering.
- Inspect the element material for damage. If any part of the element is damaged, the element must be replaced.

**WARNING**

If dirt or dust is allowed to pass through into the carburetor, the throttle may stick or become inoperable resulting in a hazardous operating condition.

**NOTICE**

If dirt gets through into the engine, excessive engine wear and possibly engine damage will occur.
NOTE
○ Element installation is performed in the reverse order of removal.
○ When installing the element, coat the lip of the element with a thick layer of all purpose grease to assure a complete seal against the air cleaner element base. Also, coat the base where the lip of the element fits.

Element Cleaning
• Clean the element in a bath of a high flash-point solvent.
• Squeeze it dry in a clean towel. Do not wring the element or blow it dry; the element can be damaged.
• Check all the parts of the element for visible damage.
• If any of the parts of the element are damaged, replace them.
After cleaning, saturate the element with a high-quality foam-air-filter oil, squeeze out the excess, then wrap it in a clean towel and squeeze it as dry as possible.

- Be careful not to tear the sponge filter.

**WARNING**

Gasoline and low-flash point solvents can be flammable and/or explosive and cause severe burns. Clean the element in a well ventilated area, and take care that there is no spark or flame anywhere near the working areas. Do not use gasoline or low-flash point solvents to clean the element.

**Oil Draining**

- If there is any oil in the reservoir, remove the plug from the lower end of the drain hose and drain the oil.
**WARNING**

Oil on tires will make them slippery and can cause an accident and injury. Be sure to install the plug in the drain hose after draining.

- Inspect the transparent reservoir located under the rear shock absorber to see if any oil has run down from the air cleaner housing.

A. Reservoir  
B. Drain Hose

Throttle Grip

The throttle grip controls the throttle valves. If the throttle grip has excessive play due to either cable stretch or maladjustment, it will cause a delay in throttle response, especially at low engine speed. Also, the throttle valves may not open fully at full throttle. On the other hand, if the throttle grip has no play, the throttle will be hard to control, and the idle speed will be erratic. Check the throttle grip play in accordance with the Periodic Maintenance Chart, and adjust the play if necessary.

**Inspection**
- Check that there is 2 ~ 3 mm (0.08 ~ 0.12 in.) throttle grip play when lightly turning the throttle grip back and forth.
- If there is improper play, adjust it.

A. Throttle Grip
B. 2 ~ 3 mm (0.08 ~ 0.12 in.)
Adjustment

- Loosen the locknut at the throttle grip, and turn the adjuster until the proper amount of throttle grip play is obtained.
- Tighten the locknut.
- If the throttle cable can not be adjusted with the adjuster at the throttle grip, use the nuts located at the carburetor.
- Loosen the locknut at the throttle grip and turn in the adjuster fully.
- Tighten the locknut.
- Loosen the nuts at the carburetor, and screw both throttle cable nuts fully so as to give the throttle grip plenty of play.
- Turn the decelerator cable nut until there is no play when the throttle grip is completely closed. Tighten the nut.
- Turn the accelerator cable nut until 2 ~ 3 mm (0.08 ~ 0.12 in.) of throttle grip play is obtained. Tighten the nut.
A. Nuts  
B. Decelerator Cable  
C. Accelerator Cable  

- With the engine idling, turn the handlebar to each side. If handlebar movement changes the idle speed, the throttle cables may be improperly adjusted or in correctly routed, or they may be damaged. Be sure to correct any of these conditions before riding.

**WARNING**

Operation with improperly adjusted, incorrectly routed, or damaged cables could result in an unsafe riding condition. Be sure the control cables are adjusted and routed correctly, and are free from damage.
Carburetors

The following procedure covers the idle speed adjustment, which should be performed in accordance with the Periodic Maintenance Chart or whenever idle speed disturbed.

 Idle Speed Adjustment

- Start the engine, and warm it up thoroughly.
- Adjust the idle speed to 1,250 – 1,350 r/min (rpm) by turning the idle adjusting screw.

A. Idle Adjusting Screw

- Open and close the throttle a few times to make sure that the idle speed does not change. Readjust if necessary.
MAINTENANCE AND ADJUSTMENT

- With the engine idling, turn the handlebar to each side. If handlebar movement changes the idle speed, the throttle cables may be improperly adjusted or incorrectly routed, or they may be damaged. Be sure to correct any of these conditions before riding.

**WARNING**
Operation with damaged cables could result in an unsafe riding condition. Replace damaged control cables before operation.

**Clutch**
Due to friction plate wear and clutch cable stretch over a long period of use, the clutch operation should be checked each day before riding the motorcycle, and in accordance with the Periodic Maintenance Chart.

**WARNING**
The engine and exhaust system get extremely hot during normal operation and can cause serious burns. Never touch a hot engine or an exhaust pipe during clutch adjustment.

**Inspection**
- Check that the clutch lever operates properly and that the inner cable slides smoothly. If there is any irregularity, have the clutch cable checked by an authorized Kawasaki dealer.
• Side the dust cover.
• Check the clutch lever play as shown in the figure.

**Clutch Lever Play**

2 ~ 3 mm (0.08 ~ 0.12 in.)

If the play is incorrect, adjust the lever play as follows.

**Adjustment**

• Slide the dust cover at the clutch lever out of place.
• Loosen the locknut at the clutch lever.
• Turn the adjuster so that the clutch lever will have the proper play.

A. Clutch Lever  
B. Clutch Lever Play  
C. Locknut  
D. Adjuster  
E. Dust Cover
WARNING
Too much cable play can prevent clutch disengagement and cause an accident resulting in serious injury or death. When adjusting the clutch or replacing the cable, be sure the upper end of the clutch outer cable is fully seated in its fitting, or it could slip into place later, creating enough cable play to prevent clutch disengagement.

- Tighten the locknut.
- Slide the dust cover back into place.
- If it cannot be done, have the clutch cable adjusted by an authorized Kawasaki dealer.

NOTE
○ After the adjustment is made, start the engine and check that the clutch does not slip and that it releases properly.

DANGER
Exhaust gas contains carbon monoxide, a colorless, odorless poisonous gas. Inhaling carbon monoxide can cause serious brain injury or death. DO NOT run the engine in enclosed areas. Operate only in a well-ventilated area.
Drive Chain

The drive chain slack and lubrication must be checked each day before riding the motorcycle, and in accordance with the Periodic Maintenance Chart for safety and to prevent excessive wear. If the chain becomes badly worn or maladjusted - either too loose or too tight - the chain could jump off the sprockets or break.

WARNING

A chain that breaks or jumps off the sprockets could snag on the engine sprocket or lock the rear wheel, severely damaging the motorcycle and causing it to go out of control. Inspect the chain for damage and proper adjustment before each ride.

Chain Slack Inspection

- Set the motorcycle up on its side stand.
- Rotate the rear wheel to find the position where the chain is tightest and measure the maximum chain slack by pulling up and pushing down the chain midway between the engine sprocket and rear wheel sprocket.

A. 35 ~ 45 mm (1.4 ~ 1.8 in.)
If the drive chain is too tight or too loose, adjust it so that the chain slack will be within the standard value.

**Drive Chain Slack**

| Standard | 35 ~ 45 mm (1.4 ~ 1.8 in.) |

**Chain Slack Adjustment**

- Remove the cotter pin, and loosen the axle nut.
- Loosen the left and right chain adjuster locknuts.

- Turn in the left and right chain adjusters evenly to obtain the standard chain slack. To keep the chain and wheel properly aligned, the notch on the right wheel alignment indicator should align with the same swingarm mark that the left indicator notch align with.
NOTE
- Wheel alignment can also be checked using the straightedge or string method.

WARNING
Misalignment of the wheel will result in abnormal wear, and may result in an unsafe riding condition. Align the rear wheel using the marks on the swingarm or measuring the distance between the center of the axle and swingarm pivot.

- Tighten both chain adjuster locknuts.
- Tighten the axle nut to the specified torque.

**Tightening Torque**

NOTE
- If a torque wrench is not available, this item should be serviced by a Kawasaki dealer.
106 MAINTENANCE AND ADJUSTMENT

- Rotate the wheel, measure the chain slack again at the tightest position, and readjust if necessary.
- Insert a new cotter pin through the axle, and spread its ends.
- Check the rear brake (see the Brakes section).

**WARNING**

A loose axle nut can lead to an accident resulting in serious injury or death. Tighten the axle nut to the proper torque and install a new cotter pin.

Wear Inspection

- Stretch the chain taut either by using the chain adjusters, or by hanging a 10 kg (22 lb) weight on the chain.
- Measure the length of 20 links on the straight part of the chain from pin center of the 1st pin to pin center of the 21st pin. Since the chain may wear unevenly, take measurements at several places.
- If the length exceeds the service limit, the chain should be replaced.
Drive Chain 20-Link Length

Service Limit: 323 mm (12.7 in.)

**WARNING**

For safety, use only the standard chain. It is an endless type and should not be cut for installation; have it installed by an authorized Kawasaki dealer.

- Rotate the rear wheel to inspect the drive chain for damaged rollers, and loose pins and links.
- Also inspect the sprockets for unevenly or excessively worn teeth, and damaged teeth.

**NOTE**

- Sprocket wear is exaggerated for illustration. See Service Manual for wear limits.

![Diagram of sprockets]

A. Good Teeth
B. Worn Teeth
C. Damaged Teeth

- If there is any irregularity, have the drive chain and/or the sprockets replaced by an authorized Kawasaki dealer.
Lubrication

Lubrication is necessary after riding through rain or on wet roads, or any time that the chain appears dry.

Use a lubricant for sealed chains to prevent deterioration of chain seals. If the chain is especially dirty, clean it using a cleaner for sealed chains following the instructions supplied by the chain cleaner manufacturer.

- Apply lubricant to the sides of the rollers so that it will penetrate to the rollers and bushings. Apply lubricant to the seals so that the seals will be coated with lubricant. Wipe off any excess lubricant.
- Wipe off any lubricant that gets on the tire surface.
Brakes

Brake Wear Inspection

Inspect the brakes for wear. For each front and rear disc brake caliper, if the thickness of either pad is less than 1 mm (0.04 in.), replace both pads in the caliper as a set. Pad replacement should be done by an authorized Kawasaki dealer.

A. Lining Thickness
B. 1 mm (0.04 in.)

Brake Fluid -

In accordance with the Periodic Maintenance Chart, inspect the brake fluid level in both the front and rear brake fluid reservoir and change the brake fluid. The brake fluid should also be changed if it becomes contaminated with dirt or water.

Fluid Requirement

Use heavy-duty brake fluid only from a container marked DOT3 or DOT4.
**NOTICE**

Do not spill brake fluid onto any painted surface.
Do not use fluid from a container that has been left open or that has been unsealed for a long time.
Check for fluid leakage around the fittings.
Check for brake hose damage.

**Fluid Level Inspection**

- The brake fluid level in the front brake fluid reservoir must be kept above the line (lower level line) next to the gauge and that in the rear brake fluid reservoir must be kept between the upper and lower level lines (reservoirs held horizontal).

![Diagram showing A. Front Brake Fluid Reservoir and B. Lower Level Line]

B. Upper Level Line
C. Lower Level Line
D. Cap

If the fluid level in either reservoir is lower than the lower level line, check for fluid leaks in the brake lines, and fill the reservoir to the upper level line. Inside the front reservoir is a stepped line showing the upper level line.

A. Front Brake Fluid Reservoir
B. Upper Level Line
WARNING
Mixing brands and types of brake fluid can reduce the brake system's effectiveness and cause an accident resulting in injury or death. Do not mix two brands of brake fluid. Change the brake fluid in the brake line completely if the brake fluid must be refilled but the type and brand of the brake fluid that is already in the reservoir are unidentified.

Fluid Change
Have the brake fluid changed by an authorized Kawasaki dealer.

Front and Rear Brakes -
Disc and disc pad wear is automatically compensated for and has no effect on the brake lever or pedal action. So there are no parts that require adjustment on the front and rear brakes.

WARNING
Air in the brake lines diminish braking performance and can cause an accident resulting in injury or death. If the brake lever or pedal feels mushy when it is applied, there might be air in the brake lines or the brake may be defective. Have the brake checked immediately by an authorized Kawasaki dealer.
Brake Light Switches

When either the front or rear brake is applied, the brake light goes on. The front brake light switch requires no adjustment, but the rear brake light switch should be adjusted in accordance with the Periodic Maintenance Chart.

**Inspection**

- Turn the ignition key to “ON”.
- The brake light should go on when the front brake is applied.
- If it does not, ask your authorized Kawasaki dealer to inspect the front brake light switch.

- Check the operation of the rear brake light switch by depressing the brake pedal. The brake light should go on after about 10 mm (0.4 in.) of pedal travel.

- If it does not, adjust the rear brake light switch.
**Adjustment**

- To adjust the rear brake light switch, move the switch up or down by turning the adjusting nut.

**NOTICE**

To avoid damaging the electrical connections inside the switch, be sure that the switch body does not turn during adjustment.

A. Rear Brake Light Switch
B. Adjusting Nut
C. Lights sooner
D. Lights later
Front Fork
The front fork operation and oil leakage should be checked in accordance with the Periodic Maintenance Chart.
After riding through muddy or dusty roads, the front inner tube should be cleaned immediately.

NOTICE
Sticking muds or dusts on the sliding surface of the front fork could damage to the oil seal, leading to an oil leak. Clean the sliding surface after each ride.

Front Fork Inspection
• Holding the brake lever, pump the front fork up and down by several times for inspection of smooth stroke.
• Visually inspect the front fork for oil leakage, scoring or scratches on the outer surface of the inner tube.

MAINTENANCE AND ADJUSTMENT

Air Pressure
The standard air pressure in the front fork legs is atmospheric pressure. The air pressure in the fork legs increases as the fork heats up, so the fork action will get stiffer as the vehicle operation progresses.
**Compression Damping Adjustment**

- Using the jack under the frame, stabilize the motorcycle.
- Place a stand or block under the engine so that the front wheel is raised off the ground.
- Clean the bottom of the outer tubes.

- To adjust compression damping, turn the adjuster on the front fork cylinder valve with the blade of a screwdriver until you feel a click. Adjust the compression damping to suit your preference under special condition.
**WARNING**

If both damping force adjusters are not adjusted equally, handling may be impaired and a hazardous condition may result. Set all suspension adjusters equally to the recommended settings.

The standard setting position of the compression damping force adjuster, for an average build rider of 68 kg (150 lb) with no passenger and no accessories is as follows.

<table>

**Rear Shock Absorber**

The rear shock absorber operation and oil leakage should be checked in accordance with the Periodic Maintenance Chart.

After riding through muddy or dusty roads, the rear shock absorber rod should be cleaned immediately.

**NOTICE**

Sticking muds or dusts on the sliding surface of the rear shock absorber could damage to the oil seal, leading to an oil leak. Clean the sliding surface after each ride.

**Rear Shock Absorber Inspection**

- Press down on the seat several times to check if the rear shock absorber stroke is smooth.
118 MAINTENANCE AND ADJUSTMENT

- Visually inspect the rear shock absorber for oil leakage.
- If any doubt about the rear shock absorber, it should be done by an authorized Kawasaki dealer.

Rebound Damping Adjustment
To adjust shock rebound damping, turn the rebound damping adjuster on the rear shock absorber lower end with the blade of a screwdriver until you feel a click.

Spring Preload Adjustment

The rear shock absorber can be adjusted by changing the spring preload for various riding and loading conditions. If the spring action feels too soft or too stiff, have it adjusted by an authorized Kawasaki dealer.
Wheels

Tires -

Payload and Tire Pressure

Failure to maintain proper inflation pressures or observe payload limits for your tires may adversely affect handling and performance of your motorcycle and can result in loss of control. The maximum recommended load in addition to vehicle weight is 181 kg (399 lb), including rider, passenger, baggage, and accessories.

- Remove the air valve cap.
- Check the tire pressure often, using an accurate gauge.
- Make sure to install the air valve cap securely installed.

A. Tire Pressure Gauge
NOTE

○ Measure the tire pressure when the tires are cold (that is, when the motorcycle has not been ridden more than a mile during the past 3 hours).
○ Tire pressure is affected by changes in ambient temperature and altitude, and so the tire pressure should be checked and adjusted when your riding involves wide variations in temperature or altitude.

Tire Wear, Damage

As the tire tread wears down, the tire becomes more susceptible to puncture and failure. An accepted estimate is that 90% of all tire failures occur during the last 10% of tread life (90% worn). So it is false economy and unsafe to use the tires until they are bald.
• In accordance with the Periodic Maintenance Chart, measure the depth of the tread with a depth gauge, and replace any tire that has worn down to the minimum allowable tread depth.

<table>
<thead>
<tr>
<th>Minimum Tread Depth</th>
</tr>
</thead>
<tbody>
<tr>
<td>Front</td>
</tr>
<tr>
<td>Rear</td>
</tr>
</tbody>
</table>

• Visually inspect the tire for cracks and cuts, replacing the tire in case of bad damage. Swelling or high spots indicate internal damage, requiring tire replacement.
• Remove any imbedded stones or other foreign particles from the tread.

**NOTE**

○ Have the wheel balance inspected whenever a new tire is installed.
WARNING

Tires that have been punctured and repaired do not have the same capabilities as undamaged tires and can suddenly fail, causing an accident resulting in serious injury or death. Replace damaged tires as soon as possible. To ensure safe handling and stability, use only the recommended standard tires for replacement, inflated to the standard pressure. If it is necessary to ride on a repaired tire, do not exceed 100 km/h (60 mph) until the tire is replaced.

NOTE

○ When operating on public roadways, keep maximum speed under traffic law limits.

|               | Rear  | Size: 4.60-18 63P | DUNLOP D605 G |

WARNING

Mixing tire brands and types can adversely affect handling and cause an accident resulting in injury or death. Always use the same manufacturer’s tires on both front and rear wheels.
**WARNING**

New tires are slippery and may cause loss of control and injury. A break-in period of 160 km (100 miles) is necessary to establish normal tire traction. During break-in, avoid sudden and maximum braking and acceleration, and hard cornering.

**Battery**

The battery installed in this motorcycle is a sealed type, so it is not necessary to check the battery electrolyte level or add distilled water. The sealing strip should not be pulled off once the specified electrolyte has been installed in the battery for initial service.

However, in order to maximize battery life and ensure that it will provide the power needed to start the motorcycle you must properly maintain the battery's charge. When used regularly, the charging system in the motorcycle helps keep the battery fully charged. If your motorcycle is only used occasionally or for short periods of time, the battery is more likely to discharge.
Due to their internal composition, batteries continually self discharge. The discharge rate depends on the type of battery and ambient temperature. As temperatures rise, so does the discharge rate. Every 15°C (59°F) doubles the rate.

Electrical accessories, such as digital clocks and computer memory, also draw current from the battery even when the key is switched off. Combine such "key-off" draws with hot temperature, and a battery can go from fully charged to completely discharged in a matter of days.

**Battery Sulfation**

A common cause of battery failure is sulfation. Sulfation occurs when the battery is left in a discharged condition for an extended time. Sulfate is a normal by product of the chemical reactions within a battery. But when continuous discharge allows the sulfate to crystallize in the cells, the battery plates become permanently damaged and will not hold a charge. Battery failure due to sulfation is not warrantable.

**Battery Maintenance**

It is the owner’s responsibility to keep the battery fully charged. Failure to do so can lead to battery failure and leave you stranded.
If you are riding your vehicle infrequently, inspect the battery voltage weekly using a voltmeter. If it drops below 12.6 volts, the battery should be charged using an appropriate charger (check with your Kawasaki dealer). If you will not be using the motorcycle for longer than two weeks, the battery should be charged using an appropriate charger. Do not use an automotive-type quick charger that may overcharge the battery and damage it.

**NOTE**
- Leaving the battery connected causes the electrical components (clock etc) to make the battery discharged, resulting in over discharge of the battery. In this case, the repair or replacement of the battery is not included in the warranty. If you do not drive for four weeks or more, disconnect the battery from the vehicle.

Kawasaki-recommended chargers are:
- Battery Mate 150-9
- OptiMate 4
- Yuasa MB-2040/2060
- Christie C10122S

If the above chargers are not available, use equivalent one. For more details, ask your Kawasaki dealer.
Battery Charging
• Remove the battery from the motorcycle (see Battery Removal).
• Attach the leads from the charger and charge the battery at a rate (ampereage×hours) that is indicated on the battery. If it is not possible to read the rate, charge the battery at an ampereage that is about 1/10th of the battery capacity.
• The charger will keep the battery fully charged until you are ready to reinstall the battery in the motorcycle (see Battery Installation).

NOTICE
Never remove the sealing strip, or the battery can be damaged. Do not install a conventional battery in this motorcycle, or the electrical system cannot work properly.

NOTE
○ If you charge the sealed battery, never fail to observe the instructions shown in the label on the battery.

Battery Removal
• Remove the left side cover.
• Disconnect the cables from the battery, first from the (–) terminal and then the (+) terminal.
MAINTENANCE AND ADJUSTMENT 129

Battery Installation

- Put the battery in the battery case.
- Connect the capped cable to the (+) terminal, and then connect the black cable to the (−) terminal.

**NOTE**

○ Install the battery in the reverse order of the Battery Removal.

**NOTICE**

Installing the (−) cable to the (+) terminal of the battery or the (+) cable to the (−) terminal of the battery can seriously damage the electrical system.

- Put a light coat of grease on the terminals to prevent corrosion.
- Cover the (+) terminal with its protective cap.
- Reinstall the parts removed.

A. (−) Terminal
B. (+) Terminal
C. Battery
D. Holder
E. Bolts

- Remove the battery holder, and take the battery out of the battery case.
- Clean the battery using a solution of baking soda and water. Be sure that the wire connections are clean.
Headlight Beam

**Horizontal Adjustment**

The headlight beam is adjustable horizontally. If not properly adjusted horizontally, the beam will point to one side rather than straight ahead.

- Turn the horizontal adjuster on the headlight rim in or out until the beam points straight ahead.

**Vertical Adjustment**

The headlight beam is adjustable vertically. If adjusted too low, neither low nor high beam will illuminate the road far enough ahead. If adjusted too high, the high beam will fail to illuminate the road close ahead, and the low beam will blind oncoming drivers.

- Turn the vertical adjuster on the headlight rim in or out to adjust the headlight vertically.
NOTE

On high beam, the brightest point should be slightly below horizontal with the motorcycle on its wheels and the rider seated. Adjust the headlight to the proper angle according to local regulations.

NOTICE

When handling the quartz-halogen bulbs, never touch the glass portion with bare hands. Always use a clean cloth. Oil contamination from hands or dirty rags can reduce bulb life or cause the bulb to explode.
Fuses
The main fuse is mounted on the starter relay located under the seat. The fuse case is located under the seat. If a fuse fails during operation, inspect the electrical system to determine the cause, and then replace it with a new fuse of proper amperage.

WARNING
Substituting fuses can cause wiring to overheat, catch fire and/or fail. Do not use any substitute for the standard fuse. Replace the blown fuse with a new one of the correct capacity, as specified on the junction box and main fuse.

General Lubrication

Lubricate the points shown below, with either motor oil or regular grease, in accordance with the Periodic Maintenance Chart or whenever the vehicle has been operated under wet or rainy conditions.

Before lubricating each part, clean off any rusty spots with rust remover and wipe off any grease, oil, dirt, or grime.

**NOTE**

○ A few drops of oil are effective to keep bolts and nuts from rusting and sticking. This makes removal easier. Badly rusted nuts, bolts, etc., should be replaced with new ones.

Apply motor oil to the following pivots -

- Side Stand
- Clutch Lever
- Front Brake Lever
- Rear Brake Pedal

Lubricate the following cables with a pressure cable luber -

- (K) Clutch Inner Cable
- (K) Throttle Inner Cables
Apply grease to the following points -
• (K) Clutch Inner Cable Upper End
• (K) Throttle Inner Cable Upper Ends

(K): Should be serviced by an authorized Kawasaki dealer.

NOTE
○ After connecting the cables, adjust them.

Cleaning Your Motorcycle

General Precautions
Frequent and proper care of your Kawasaki motorcycle will enhance its appearance, optimize overall performance, and extend its useful life. Covering your motorcycle with a high quality, breathable motorcycle cover will help protect its finish from harmful UV rays, pollutants, and reduce the amount of dust reaching its surfaces.
WARNING

Build-up of debris or flammable material in and around the vehicle chassis, engine, and exhaust can cause mechanical problems and increase the risk of fire. When operating the vehicle in conditions that allow debris or flammable material to collect in and around the vehicle, inspect the engine, electrical component and exhaust areas frequently. If debris or flammable materials have collected, park the vehicle outside and stop the engine. Allow the engine to cool, then remove any collected debris. Do not park or store the vehicle in an enclosed space prior to inspecting for build-up of debris or flammable materials.

- Be sure the engine and exhaust are cool before washing.
- Avoid applying degreaser to seals, brake pads, and tires.
- Always use non-abrasive wax and cleaner/polisher.
- Avoid all harsh chemicals, solvents, detergents, and household cleaning products such as ammonia-based window cleaners.
- Gasoline, brake fluid, and coolant will damage the finish of painted and plastic surfaces: wash them off immediately.
- Avoid wire brushes, steel wool, and all other abrasive pads or brushes.
- Use care when washing the headlight lens, and other plastic parts as they can easily be scratched.
- Avoid using pressure washers; water can penetrate seals and electrical components and damage your motorcycle.
Avoid spraying water in delicate areas such as in air intakes, carburetors, brake components, electrical components, muffler outlets, and fuel tank openings.

Washing Your Motorcycle

- Rinse your bike with cold water from a garden hose to remove any loose dirt.
- Mix a mild neutral detergent (designed for motorcycles or automobiles) and water in bucket. Use a soft cloth or sponge to wash your motorcycle. If needed, use a mild degreaser to remove any oil or grease build up.
- After washing, rinse your motorcycle thoroughly with clean water to remove any residue (residue from the detergent can damage parts of your motorcycle).
- Use a soft cloth to dry your motorcycle. As you dry, inspect your motorcycle for chips and scratches. Do not let the water air dry as this can damage the painted surfaces.
- Start the engine and let it idle for several minutes. The heat from the engine will help dry moist areas.
- Carefully ride your motorcycle at a slow speed and apply the brakes several times. This helps dry the brakes and restores them to normal operating performance.
- Lubricate the drive chain to prevent rusting.
NOTE
● After riding in an area where the roads are salted or near the ocean, immediately wash your motorcycle with cold water. Do not use warm water as it accelerates the chemical reaction of the salt. After drying, apply a corrosion protection spray on all metal and chrome surfaces to prevent corrosion.
● Condensation may form on the inside of the headlight lens after riding in the rain, washing the motorcycle or humid weather. To remove the moisture, start the engine and turn on the headlight. Gradually the condensation on the inside of the lens will clear off.

Semi-gloss Finish
To clean the semi-gloss finish;

Painted Surfaces
After washing your motorcycle, coat painted surfaces, both metal and plastic, with a commercially available motorcycle/automotive wax. Wax should be applied once every three months or as conditions require. Avoid surfaces with "satin" or "flat" finishes. Always use non-abrasive products and apply them according to the instructions on the container.
Plastic Parts

After washing use a soft cloth to gently dry plastic parts. When dry, treat the headlight lens, and other non-painted plastic parts with an approved plastic cleaner/polisher product.

**NOTICE**

Plastic parts may deteriorate and brake if they come in contact with chemical substances or household cleaning products such as gasoline, brake fluid, window cleaners, thread-locking agents, or other harsh chemicals. If a plastic part comes in contact with any harsh chemical substance, wash it off immediately with water and a mild neutral detergent, and then inspect for damage. Avoid using abrasive pads or brushes to clean plastic parts, as they will damage the part’s finish.
Chrome and Aluminum

Chrome and uncoated aluminum parts can be treated with a chrome/aluminum polish. Coated aluminum should be washed with a mild neutral detergent and finished with a spray polish. Aluminum wheels, both painted and unpainted can be cleaned with special non-acid based wheel spray cleaners.

Leather, Vinyl, and Rubber

If your motorcycle has leather accessories, special care must be taken. Use a leather cleaner/treatment to clean and care for leather accessories. Washing leather parts with detergent and water will damage them, shortening their life.

Vinyl parts should be washed with the rest of the motorcycle, then treated with a vinyl treatment.

The sidewalls of tires and other rubber components should be treated with a rubber protectant to help prolong their useful life.

**WARNING**

Rubber protectants can be slippery and, if used on the tread area, cause loss of traction resulting in accident causing injury or death. Do not apply rubber protectant to any tread area.
Preparation for Storage:
- Clean the entire vehicle thoroughly.
- Run the engine for about five minutes to warm the oil, shut it off and drain the engine oil.

**WARNING**

Engine oil is a toxic substance. Dispose of used oil properly. Contact your local authorities for approved disposal methods or possible recycling.

- Put in fresh engine oil.
- Empty the fuel from the fuel tank, and empty the carburetors by unscrewing the drain screw at each float bowl. (If left in for a long time, the fuel will break down and could clog the carburetors.)
**WARNING**

Gasoline is extremely flammable and can be explosive under certain conditions, creating the potential for serious burns. Turn the ignition key to “OFF”. Do not smoke. Make sure the area is well-ventilated and free from any source of flame or sparks; this includes any appliance with a pilot light. Gasoline is a toxic substance. Dispose of gasoline properly. Contact your local authorities for approved disposal methods.

- Remove the spark plugs and spray fogging oil directly into each cylinder. Turn the engine over several times with the starter button to coat the cylinder wall. Install the spark plug.

**WARNING**

An air/oil mist may be forcibly ejected from the spark plug holes and could get into your eyes. Do not lean over the engine when performing this procedure. If you do get oil in your eyes, wash them immediately with liberal amounts of clean, fresh water and consult a physician as soon as possible.

- Reduce tire pressure by about 20%. 
Set the motorcycle on a box or stand so that both wheels are raised off the ground. (If this cannot be done, put boards under the front and rear wheels to keep dampness away from the tire rubber.)

Spray oil on all unpainted metal surfaces to prevent rusting. Avoid getting oil on rubber parts or in the brakes.

Lubricate the drive chain and all the cables.

Remove the battery, and store it where it will not be exposed to direct sunlight, moisture, or freezing temperatures. During storage it should be given a slow charge (one ampere or less) about once a month. Keep the battery well charged especially during cold weather.

Tie plastic bag over the exhaust pipe to prevent moisture from entering.

Put a cover over the motorcycle to keep dust and dirt from collecting on it.

Preparation after Storage:

- Remove the plastic bag from the exhaust pipe.
- Install the battery in the motorcycle and charge the battery if necessary.
- Make sure the spark plugs are tight.
- Fill the fuel tank with fuel.
- Check all the points listed in the Daily Checks section.
- Lubricate the pivots, bolts, and nuts.
Your satisfaction is important to your authorized Kawasaki dealer and to Kawasaki Motors Pty., Ltd. If you have a problem concerning warranty or service, please take the following action:

Contact the owner and/or service manager of your authorized Kawasaki dealer. Fully explain your problem and ask for assistance in resolving the situation. The OWNER of the dealership is an independent business person and is concerned with your satisfaction and your future business. For this reason the owner is in the best position to assist you. Also, all warranty and service matters are handled and resolved through the authorized Kawasaki dealer network.

If you are unsatisfied after working with your Kawasaki dealer and feel you still require further assistance, WRITE to the address below. Please be certain to provide the model, product identification number, mileage or hours of use, accessories, dates that events occurred and what action has been taken by both you and your dealer. Include the name and address of the dealership. To assist us in resolving your inquiry, please include copies of related receipts and any other pertinent information including the names of the dealership personnel with whom you have been working in the resolution of your problem.
Upon receipt of your WRITTEN correspondence we will contact the dealership and work with them in resolving your problem.

In order to provide a permanent record, all warranty and service resolutions take place only through WRITTEN correspondence.

To help preserve the environment, properly discard used batteries, tires, oils and fluids, or other vehicle components that you might dispose of in the future. Consult your authorized Kawasaki dealer or local environmental waste agency for their proper disposal procedure. This also applies to disposal of the entire vehicle at the end of its life.
All warning labels which are on your vehicle are repeated here. Read labels on your vehicle and understand them thoroughly. They contain information which is important for your safety and the safety of anyone else who may operate your vehicle. Therefore, it is very important that all warning labels be on your vehicle in the locations shown. If any label is missing, damaged, or worn, get a replacement from your Kawasaki dealer and install it in the correct position.

**NOTE**

○ The sample warning labels in this section have part numbers to help you and your dealer obtain the correct replacement.

IMPORTANT DRIVE CHAIN INFORMATION

To prevent an accident and/or damage to the motorcycle, the drive chain must be properly maintained. It should be lubed every 1000mi (1600km) and adjusted as often as necessary to keep chain slack at about 20inch (5cm). Check measured sideway clearance between sprockets on the lower chain run with the motorcycle on the side stand. The standard chain to an 18inch (457mm) with expected service life of 15000mi (24000km) or 30000mi (48000km), depending on the severity of use and the frequency of lubrication and adjustment. For safety, replace the chain with only the standard chain. Use a 70-pound force to test 30inch (75cm) of tension. See the Owner's Manual for chain information.
TIRE AND LOAD DATA

The stability and handling characteristics of this motorcycle could become unsafe by the use of improper tire inflation pressures, overworn tires, unsuitable replacement tires, or overloading. When tire tread wears down to the limit, replace the tire with only the standard tire. Maintain the inflation pressure specified.
